

APPENDIX A

Name:	Preben Bøggwald
Student No.:	216785

Concept evaluation of tethered station keeping system for a mono-hull floating offshore vertical axis wind turbine

Contents

Sheet number	Title	Description
2	Substructure	Contains the data from the substructure parameter study
3	Buoyant docking station	Contains the data from the BDS parameter study

This document is protected from editing.

Spreadsheet results for substructure (floater) during preliminary design
Note that EC1 represents the mild wave-wind condition used to determine the static angle for tow-out. For more information see main document

Matrix experiment setup table with columns 1-5 Units and 8-12 meters. Rows include Outer diameter of structure, Draft of structure, Permanent ballast fraction, and Colour coding.

Spreadsheet results for Substructure at a permanent ballast fraction of 80%

Main data table for 80% ballast fraction. Columns include ST-NUM, INTPUTS (Outer diameter, Draft, Wt, Freeboard, PBF), INTERTIAL PROPERTIES (Topside, Dry structure, Ballast, etc.), Displacement, Stability parameters, Force, Added mass estimates, Uncoupled natural periods, and Moment.

Spreadsheet results for Substructure at a permanent ballast fraction of 60%

Main data table for 60% ballast fraction. Columns include ST-NUM, INTPUTS (Outer diameter, Draft, Wt, Freeboard, PBF), INTERTIAL PROPERTIES (Topside, Dry structure, Ballast, etc.), Displacement, Stability parameters, Force, Added mass estimates, Uncoupled natural periods, and Moment.
